

Natural Language Processing: A Survey

Natural Language Processing (NLP) is a field of artificial intelligence that focuses on the interaction between computers and human language. Transformer-based models like BERT and GPT have achieved state-of-the-art results on many NLP benchmarks.

Key techniques include tokenization, word embeddings, attention mechanisms, and transfer learning. The attention mechanism allows models to weigh the importance of different words in a sequence.

Reinforcement learning from human feedback (RLHF) has become a standard technique for aligning large language models (LLMs) with human preferences and values.
